

EnterpriseVue for ISM Service Description

Intellitactics EnterpriseVue for ISM™ (EnterpriseVue) is designed to increase effectiveness of enterprise security by providing a dynamic dashboard to increase access to security information. EnterpriseVue is configured to display graphical and tabular reports appropriate to multiple enterprise audiences like other IT operations functions, employees that benefit from awareness to security policy enforcement, executive management and internal auditors. EnterpriseVue is another application that benefits from Intellitactics™ Security Data Warehouse (SDW). The Intellitactics SDW is a high performance, multi-dimensional data store that quickly retrieves raw logs, events and summarized detail for reports and is essential to the performance of Intellitactics™ Security Manager (ISM) and the SIEM appliances Intellitactics™ SAFE.

Share Security Effectiveness

Included with EnterpriseVue is one week with an Intellitactics Solution Architect with the objective to quickly unlock the potential of this high impact dashboard.

Highlights:

- Intellitactics Solution Architects will work with you to quickly install EnterpriseVue with Intellitactics Security Manager's Security Data Warehouse (SDW), which serves as your primary repository.
- EnterpriseVue will be integrated with an existing enterprise portal if there is one
- Then the administrator and your operations personnel will be set up to use EnterpriseVue, establishing the navigation tree and user groups.
- Next, access will be configured and connectivity established for the groups you identify. The primary design of the dashboard will be documented and implemented to reflect internal policies
- Finally, packaged reports will be selected and enabled in EnterpriseVue in tabular or graphic formats. During this time EnterpriseVue will also be branded to reflect your identity.

Intellitactics EnterpriseVue

These charts show virus infection rates as detected by an AV scanner within the enterprise network.

The screenshot shows the Intellitactics EnterpriseVue dashboard with a report titled 'Windows Account Enabled'. The report includes a table with columns: 'Event ID', 'Timestamp', 'Reporting Host', 'Using Account', and 'Source'. The table contains several rows of data, including event IDs like 'windows-accounts-enabled' and timestamps from 2010-08-25.

This report features data

on *Windows Account Creation*

This report is often used in PCI compliance to monitor the use of administrative privileges.

Optimizing EnterpriseVue

There are endless opportunities to enrich the EnterpriseVue dashboard with the Extended Service Package.

- **More data from external repositories:** In addition to all the information stored in the SDW of Intellitactics Security Manager, EnterpriseVue easily imports security data from other external repositories. And, EnterpriseVue easily incorporates RSS feeds like industry and product relevant information from the Intellitactics blog – www.enterprisesecurityblog.com
- **More reports:** In addition to the 1400 reports packaged with Intellitactics Security Manager you can create new reports using any data stored in the SDW. You may configure a standard navigation tree for all internal clients and other IT operations groups and add unique folders aligned to their needs. All report criteria can be hard coded or you can provide certain users with criteria they can configure on demand
- **Support a global client base:** EnterpriseVue is multi-lingual capable. Working together Intellitactics' Solution Architects and your translation team can provide reports in the user's language of choice.
- **Solution Architects work from a Statement of Work (SOW) developed by an engagement manager collaborating with you to achieve your objectives.** Details about the EnterpriseVue service package can be found in the sample on the website: EnterpriseVue for ISM Implementation Services

Each group can have their own tree and specific content. This group, focused on PCI compliance, has a dashboard featuring reports and charts relevant to PCI compliance status.

EnterpriseVue enables you to link to any web accessible tool, private or publically available on the internet. This feature can be used to provide your internal clients or affiliates with self-service tools that may reduce support load, for example.

This simple graphic proves that the SIEM is acquiring data and enables other IT operations groups to monitor event volumes.

Committed to Your Success

Intellitactics features a low total cost of ownership. Primarily agentless data collection reduces the burden on the infrastructure. The unique Security Data Warehouse, which combines an embedded, self-managing relational database requiring no DBA and compressed stores of raw logs, is easy on the storage budget. The product architecture grows with you as you add more data sources or evolve your risk policies. Intellitactics features 'security know-how' in packaged reports, metrics and correlations. The Customer Center, located at www.intellitactics.com, features instant access to new reports and metrics, and automates support functions for faster response to all inquiries.
