

Quest SAFE and Secure

Security as a Service

These days, budgets often get re-prioritized and new headcounts get put on hold. Dedicated security resources get distracted with other tasks when organizations get downsized. Unfortunately, expectations for securing critical data and passing compliance audits continue to increase. Now, with **Security as a Service** (SAAS) from Quest you can be ready for your next compliance audit (PCI, HIPAA, SOX...) and still sleep at night.

Quest, as an established managed security service provider, offers a **virtual SOC** (security operations center) so you can automate log management, event management and

incident response without the overhead or delays associated with buying and implementing a security information and event management (SIEM) appliance. One safe and simple decision to use Quest provides expert assistance and the highly capable Intellitactics SAFE security management appliance without a capital investment. By selecting Quest, you immediately improve your risk posture. Quest managed, on or off-premise Intellitactics SAFE gives you control over all the logs you need to prove compliance and the security events you need to safeguard information assets.

Quest SAFE and SECURE

Quest SAFE and Secure includes log collection, storage, security event monitoring, analysis with extensive compliance and operational reporting.

- Real time collection of logs from anything located anywhere
- Continuous log parsing to improve understanding
- Log retention aligned with industry or internal policies
- Powerful, automated correlation of security events to accelerate investigation and response to threats
- Audit ready compliance reports for all stakeholders
- Security operations reports enable collaboration with your virtual SOC
- Dynamic, interactive dashboard a window into the results of security service

Anyway You Want It

The Quest security professionals are your virtual SOC team and the Quest redundant operations center and SAS 70 Type II certification provide the assurance and peace of mind to choose SAS over owning and operating a SIEM appliance.

Quest SAFE and SECURE provides as much or as little of the control without the overhead of appliance ownership.

- You can buy it as a product
- Choose equipment as a service -- We own it, you use it
- We can do it all -- turn-key monitoring and compliance as a service
- Already own it? Let us manage it for you

Intellitactics SAFE

Quest will implement a right sized Intellitactics SAFE appliance in your data center, then remotely connect to SAFE to monitor and manage logs and security events. Intellitactics SAFE elevates the practice of log management enabling Quest to do more with your logs and events.

Intellitactics SAFE offers more advantages over other SEM appliances:

- **Only one appliance** is required for managing most security infrastructures and requires no agents or managed devices. This means minimal disruption to your security infrastructure and limited rack space.
- **Audit ready reporting** on compliance objectives for multiple regulatory and industry standards
- Real time access to **security events** and speedy retrieval of underlying logs which improves understanding of evolving threats and attacks
- Fully integrated **visual analysis** that quickly isolates sources and vulnerable targets
- **Role based dashboards** displaying up to the minute status of IDS, anti-virus and more

By combining the power of SAFE with the expertise of the QUEST security team, you can make one decision that enables complete control of your security infrastructure.

Quest SAFE and SECURE is a smart choice:

- Simple to deploy--with almost immediate results
- Interactive dashboard and user interface provides an intuitive way for your team to participate as much or as little as time permits
- Affordable service offering prevents delays that might put you at risk
- Integrates security event management with other services like unified threat management, managing your anti-virus estate or implementing a data protection strategy
